

Clinical Query

- Create clinical query to document and organize clinical queries arising on a daily basis at point of care of a specific patient.
- Choose a disease by a category such as diagnosis, treatment etc or, drug with a drug profile , such as side effects, contraindications etc.
- Submit your queries to our experts or answer your self to earn CME credits.

Create a Clinical Hypothesis

- Clinical hypothesis provides a forum to create, share clinical ideas and perspectives.
- Create a a clinical hypothesis by using available template, and save it for yourself or submit to publish in an online clinical hypothesis journal.

Become an Expert

- Clinical pearl provides a unique opportunity to become an expert for a chosen specialty, disease or drug.
- An expert will be for each categorization of the pearl (General, Specialty, Drugs).
- The system allows an expert to review, approve, reject or answer (in case of query) all posts by the user. Only registered users can be an expert.
- A single user can be an expert for multiple specialties or multiple diseases or multiple drugs, whereas only one expert user is allowed for General category.

About Clinical Pearl

What is Clinical Pearl?

Your personal CME.

Clinical Pearl is an online clinical tool which allows clinicians and other healthcare providers to document, organize, and share their clinical experience, as well as view others' clinical insights. Clinicians can also submit their clinical pearls and queries to be published in an online clinical repository, after a critical editorial evaluation.

Why do we need Clinical Pearl?

Clinical pearl solves the problem of "How can a clinician keep track of clinical queries, or clinical pearls, arising at the point of care of a specific patient?"

It is a "true continuing medical education", providing tools to keep track of clinical queries and pearls continuously arising at the point of care of an individual patient.

How does it help physicians and healthcare providers to meet required academic and clinical learning objectives?

Clinical pearl's core values of self learning and assessment modules provides professional development activities for all healthcare providers. Clinical pearl promotes practice based learning and scholarly activities; an essential competency of ACGME learning objectives for physicians as well as of resident review committee (RRC) for residents.

Clinical pearl is "Practice Based Medicine".

Clinical Pearl is practice based medicine, generating a wealth of patient specific clinical information, from years of experience of our member clinicians.

Evidence based medicine comprised of a triad of "best available clinical evidence, Individual clinical judgment of a physician, and patient values and expectations. Clinical pearl provides the missing pieces of "individual clinical judgment and patient's values to complete the triad of evidence based medicine. A blend of clinical pearl, Practice Based Medicine™ (PBM), with evidence based medicine (EBM)) will likely to serve a valuable and complementary role in clinical learning at all levels of medical education.

Clinical pearl is a clinical information repository open to a worldwide clinical community.

Clinical pearl is designed to provide a forum to facilitate interaction among clinicians in order to promote exchange of clinical insights. It is open to clinicians, healthcare providers, residents, medical students, from all over the world. Our goal is to retrieve the most relevant clinical information (clinical pearls) regarding patient care, generated from the years of clinical experience of these clinicians.

Clinical Pearl provides clinical query and answering service

Clinical pearl offers a Clinical query and answer service to make a learning experience more exciting and enjoyable. Our experts answer clinical queries posed by clinicians and turn them into clinical pearls. Registered users can create a clinical query, save it for later, or submit to experts for a given clinical topic or drug category. For each categorization of the pearl (general, Specialty, Drugs), an assigned expert will review, approve, reject or answer (in case of query) the clinical posts by the user.

Clinical Pearl promotes the brainstorming of new clinical ideas.

Clinical pearl is a forum for "clinical brainstorming of new research ideas in theoretical stages", in order to foster the diversity and debate upon which medical research thrives. A clinical hypothesis template is an organized clinical hypothesis generating tool to assess and evaluate research theories. Clinicians can document, organize and submit for publishing of their clinical ideas and perspectives in an online "clinical hypothesis journal".

Clinical Pearl provides a clinical forum to instigate a clinical debate.

Clinical pearl provides an insight into a collective clinical wisdom of other clinicians. Clinicians can not only view, but also rate, comment and challenge clinical pearls and clinical hypothesis of their peers to further improve the quality of clinical information.

Clinical Pearl provides an opportunity to earn CME credits.

Clinical pearl provides an opportunity to earn CME credits by participating in self learning modules of clinical pearls, clinical queries and clinical hypothesis on a ongoing basis.

How It Works

Create Pearl

- Start taking a note of that new clinical learning about a specific patient at point of care, by creating a new pearl.
- Create a pearl by selecting a specialty, disease, procedure or a drug.
- Keep your pearls private or submit for publishing online to our editorial board.
- Rate, comment or challenge others' clinical pearls, and vice versa.
